

# LIVING NATURAL RESOURCES

# Questions we ask

- What resources are present?
- In what condition?
- How do we measure this and....
- How do we manage and what for?
  - Biodiversity and/conservation
  - Ecosystem function
  - Restoration
  - Harvest
  - Recreation

# NRCM—Scale and Context

# SCALE

Biosphere

S. Appalachians

Watershed

Forest Stand

Rock Outcrop

Management and policy decisions

Wildlife and Resource Ecology

Successful NRCM--MUST  
be able to integrate  
information across scales

# What Resources are Present?

- Quantity and distribution of....
  - Forest types
  - Wildlife
  - Ecosystem components
  - Human land use
- Quality of resources for....
  - Wildlife habitat
  - Conservation
  - Recreation, Harvest etc.

A photograph of a dense forest with tall, slender evergreen trees. The trunks are brown and vertical, and the foliage is a vibrant green. The word "Forests" is written in a large, bold, yellow font in the center of the image.

# Forests

# How do we “measure” forests?

- Age of stand
- Density of trees
- Fragmentation
- Forest Type—dominant species in overstory
- Structure—layers
- Human land use (roads, houses, etc.)
- Ecologic processes---biodiversity, nutrient cycles, productivity

# Forest Ecology

## Disturbances can reverse or alter patterns

Fire, Storms, Floods, logging, development, disease, invasive species

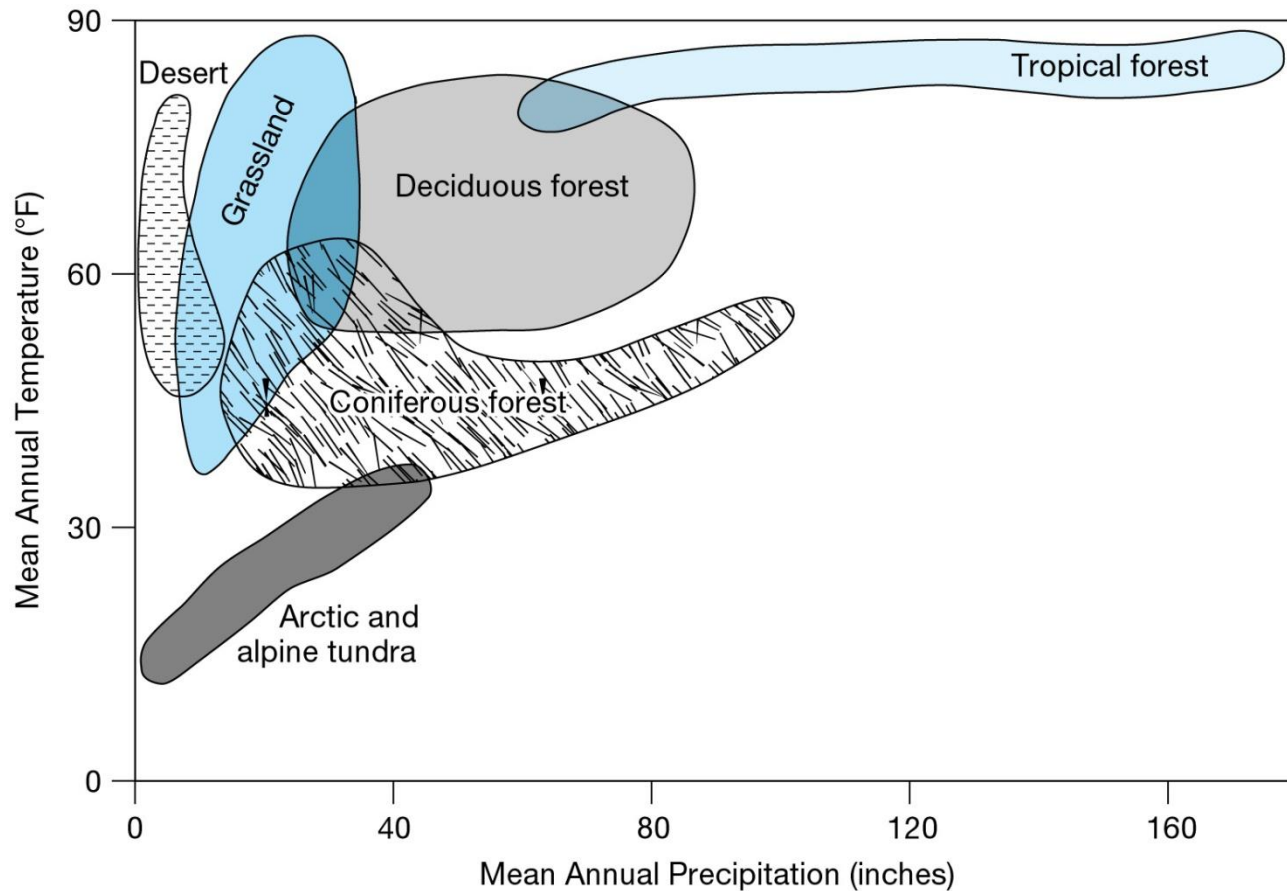

Natural disturbances tend to cause aesthetic damage others cause permanent changes

# Forest Ecology

Forests: What we see is a snapshot in time

A response” to a suite of short to long term and local to global processes.

# Local Forest Ecology—A fight for light.

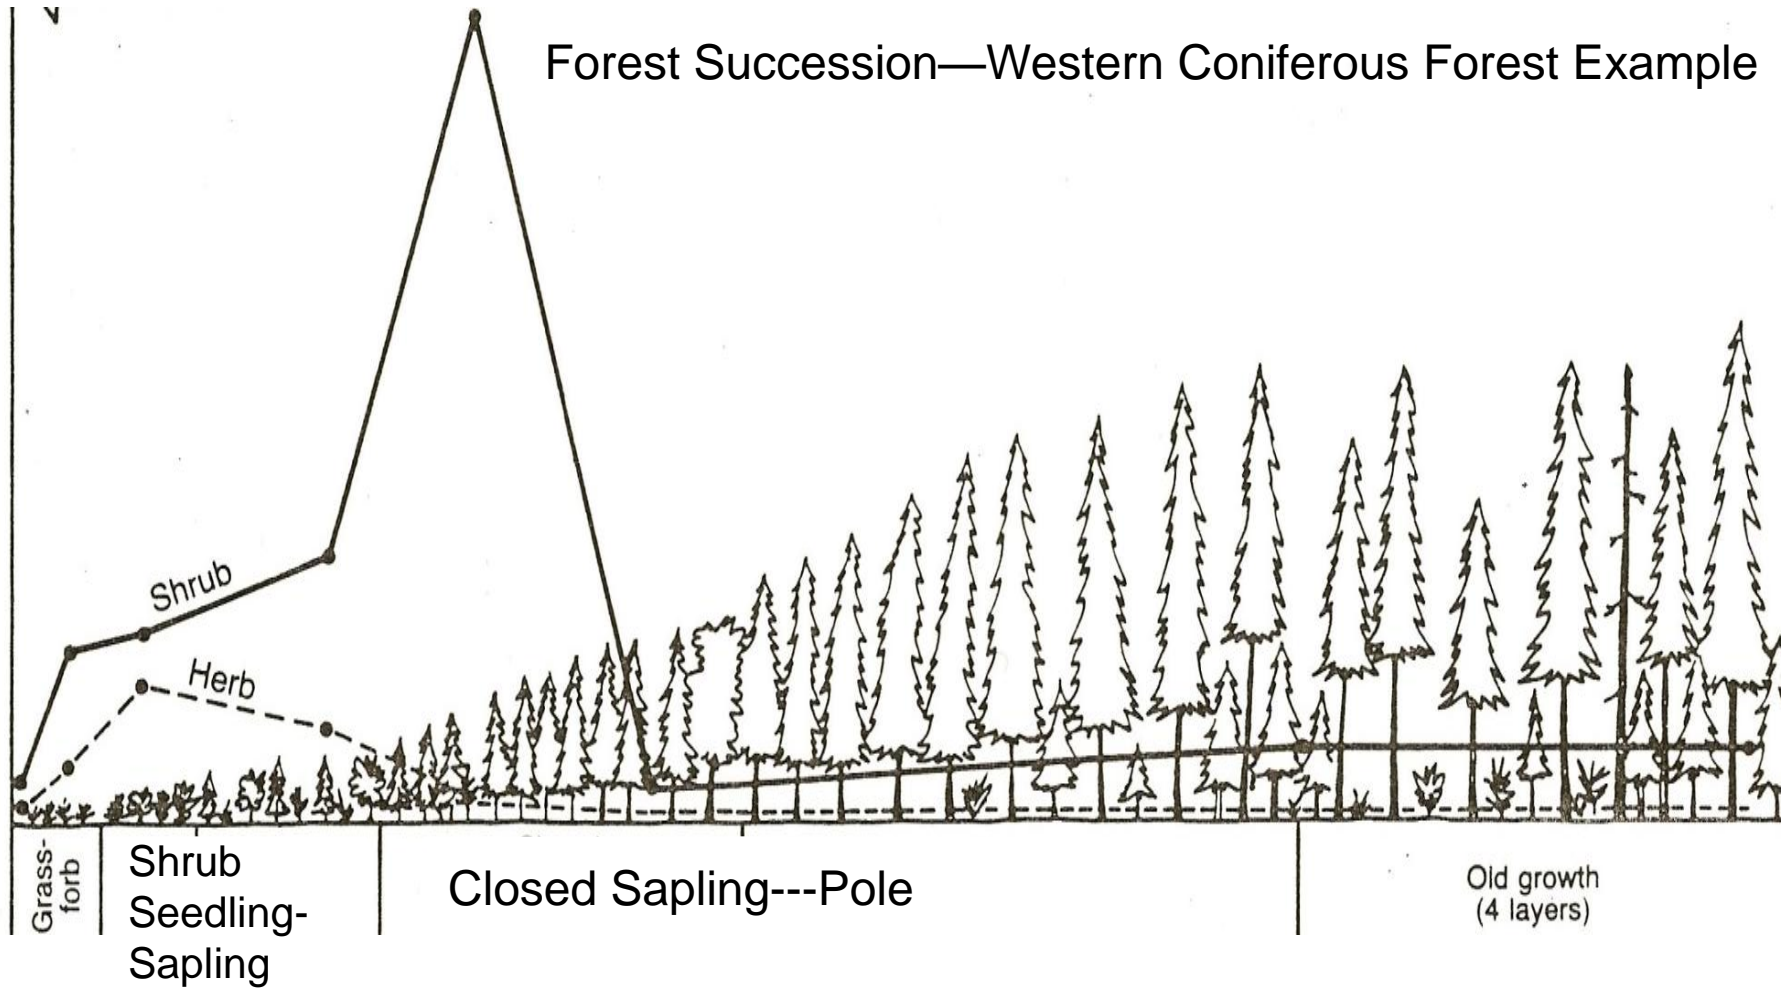

Succession—progression toward mature forest

Slower growing species eventually “shade out” pioneer species

Changes over time as some get “out competed” for light and nutrients.

# Forest Succession—Western Coniferous Forest Example

SNAPSHOT—many processes at work

# GEOPHYSICAL FACTORS

**Geologic history**

Global-LONG term

**Climate (temp, precip)**

**Storm/disaster**

**Fire**

**LIGHT (Solar Radiation)**

**Soil nutrients**

Local--Immediate

# Biological and Human Factors

Competition

Disease

Herbivory

Harvest

Development

Invasive Species

Ecology impacts how  
we can use a forest  
and should inform how  
we manage it.

# Yellowstone Fires of 1988

# Values/Demands placed on a forest

A photograph of a forest landscape, likely a mountain slope, showing a mix of green trees and grassy areas. Several dead tree trunks are visible on the ground. The image is used as a background for text labels representing different values and demands placed on the forest.

Ecologic health

Recreation

Aesthetics

Preservation

Timber

Intrinsic

How do we manage for all these values? Can we?

# Sustainable Forestry

## HARVEST

**Clear Cut**—takes all board feet

**Selective (thinning)**—takes a % board feet

**Best Management Practices**

How many ha of each type?

Estimate the maximum sustainable harvest per year in board feet/year from the site shown.

Use a combination of at least 2 approaches.

Challenge: Add a small 10 ha (any shape) park for recreation/wildlife to your design for each.

Streams must be buffered by at least 100m (1 side of a box)

No new roads.

Work individually or in pairs but I need a sheet from everyone.

# Harvesting Trees—How often?

“Stand replacement time”

“Harvest interval”

In general if your stand takes 40 years to replace then your yearly harvest needs to max out at  $1/40^{\text{th}}$  of your land area.

# Harvesting Trees—How to harvest?

Copyright © 2005 Pearson Prentice Hall, Inc.

# Harvesting Trees

**Clear Cut**—takes all board feet

**Selective (thinning)**—takes a % board feet

**Shelterwood**—takes % 60%

**Strip**—takes all w/in a strip

How many ha of each type?

Estimate the maximum sustainable harvest per year in board feet/year from the site shown.

Use a combination of at least 2 approaches.

Challenge: Add a small 10 ha (any shape) park for recreation/wildlife to your design for each.

Streams must be buffered by at least 100m (1 side of a box)

No new roads.

Work individually or in pairs but I need a sheet from everyone.

## Legend

- Clearcut
- Old 100,000 BF/ha
- Mature 75,000 BF/ha
- ✎ ✎ ✎  
✎ ✎ ✎  
✎ ✎ ✎ Pole 50,000 BF/ha
- Sapling Out of commission for at least 30 years

Boxes = 1ha

How do we achieve sustainability in use, management, preservation?

## Legend

-  Clearcut
-  Old 100,000 BF/ha
-  Mature 75,000 BF/ha
-  Pole 50,000 BF/ha
-  Sapling

Boxes show 1 ha and 1/4 ha

# Forest and Wildlife Habitat Management and Conservation

## Ecology

What resources do they require?

How good are these resources?

How will animals use resources?

What other factors are at work?

## Management

What do we conserve?

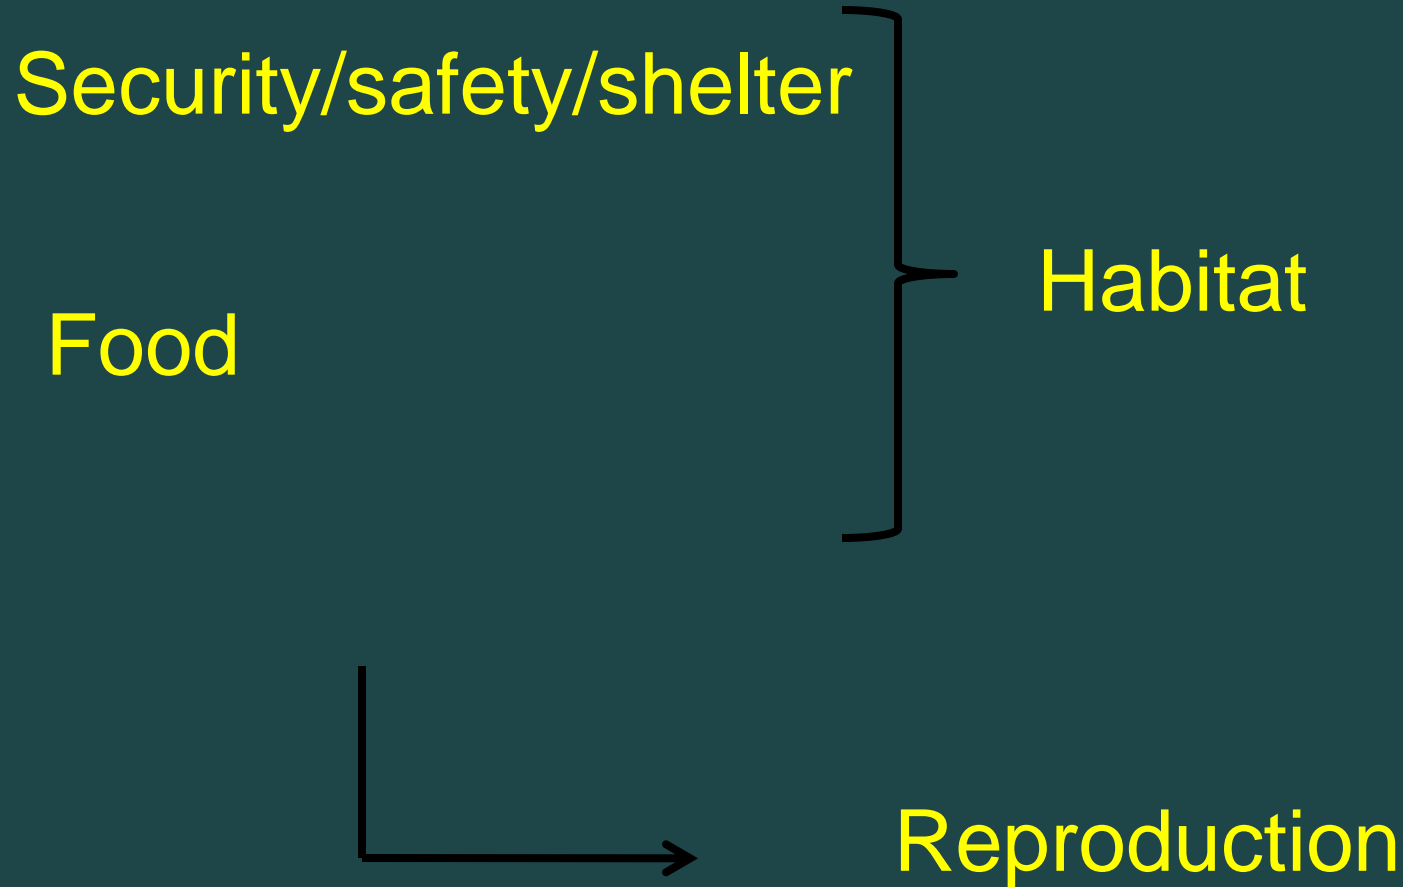

What can we manage?

Other factors?

What should we do?

**What will happen to the population?**

How do we relate forests measurements to the basic needs of wildlife?

**Food/Nutrition—source of energy ultimately from the sun and essential nutrients— used for chemical energy and cellular activity**

**Security—provided by habitat, physical appearance, behavior or even social interactions.**

**Reproduction—only possible when other conditions are met.**

**Survival—to breeding age**

**Recruitment—young reaching next year**

- Habitat—must provide physical conditions resources and space for shelter, feeding, reproduction.
- Loss of habitat—leading cause of biodiversity declines
- We use those resources too.

# Wildlife and Forest Management

Much of the focus of managing resources involves assessing and/or manipulating populations

Habitat management---to provide conditions for species to maintain, increase or in the case of nuisance, decrease.

Direct manipulation—planting, harvest, hunting, fishing, enhancement

MUST understand the ecology of species in order to best try to manage habitats and populations---knowing why and how about their ecology is essential.

# How do we decide “how good” resources are for wildlife?

# WHAT TO MEASURE?

**REPRODUCTION:** Low numbers of mature bulls  
➤ widely accepted  
➤ empirical data doesn't generally support its role

## PREDATORS

**VERY controversial**

- \*wide public acceptance
- \*declines began before predator controls stopped
- \*MUCH more empirical work needed

## FOOD SUPPLY

- Generally has been discounted by commonly used habitat evaluations
- Poor condition—nutritional needs not being met in some areas

## CRITICAL HABITAT RESOURCES

**Cover, Roads, Landscape Pattern:** often used as surrogates for factors more difficult to measure

# Challenges

How to measure forage selection and diet quality in wild animals?

How do we measure detailed habitat selection at multiple scales?

How do we relate this to population dynamics in order to manage habitat?

# Habitat Suitability Index & Habitat Effectiveness Index (HSI & HEI)

## SCORES:

1. Amount, size, and spacing of **Forage & Cover**
2. Density of, or distance to, open **Roads**
3. Scored on a 0 – 1.0 scale (unsuitable-optimum)

Overall habitat value is computed as the geometric mean of all inputs

$$[\text{Forage Area} \times \text{Forage 'quality'} \times \text{Cover Quantity} \times \text{Roads}]^{0.25}$$

0-<0.2 = Non-Viable

0.2-0.4 = Marginally Viable

0.4-0.6 = Viable

>0.6 = Highly Viable

1.0 = Optimal

## Habitat Suitability Index (HSI)

Determine critical habitat elements and 0-1.0 (or other )scoring system representing quality for wildlife.

Provides a 0-1.0 index of “habitat viability”

0 = Non-viable

0.5 = Marginal

1.0 = Highly

Intended as an efficient indicator

**Habitat: Security/shelter, Food, Nutrients, Territory/Space**

# HABITAT SUITABILITY INDEX WORKSHEET

Names:

	Forest (No Roads)	Forest /roads	Forest- Clearing (No Roads)	Clearing (With roads)	Water & Forest	Forest & Bare Soil	Mostly Bare Soil	Final HSI—add all columns
Multiplier for Species A								
Multiplier for Species B								
Number of Cells								
Number of Cells times the multiplier and divided by 100 <b>Species A</b>								
Number of Cells times the multiplier and divided by 100 <b>Species B</b>								

Final HSI

Species A \_\_\_\_\_

Species B \_\_\_\_\_

Which species is better suited to this habitat?

What can you tell me about the ecologic needs of Species A vs. B?

Even “contiguous” tracts of forest are actually a mosaic of various stages/conditions due to interacting environmental factors

# Strategies

Species differ in their methods of finding food, avoiding becoming food, finding mates etc.

Costs vs. benefits must continually be “weighed” in making decisions about habitat use, movements etc.

The better understanding managers have of these strategies and the ecological needs of wildlife the better they can “manage” habitat to create conditions needed to best provide.

# Some “Strategies”

Feeding: Carnivore, omnivore, herbivore, parasite, scavenger, decomposer, producer.

Activity: Diurnal, nocturnal, arboreal, fossorial, migration, hibernation

Reproduction: Monogamous, polygyny, polyandry

# Wildlife Management—providing habitat or manipulating populations

The availability of adequate **habitat**

- Food and Space
- Reproduction
- Safety
- Dispersal/Migration routes
- Territory defense

The loss of most biodiversity on Earth can be linked to habitat loss or degradation

# What do we conserve, restore or manage?

## **Wildlife**

**Presence/Absence of key species**

**Population Size (increase, decrease, stay the same)**

**Population demographics (age structure, birth rates, recruitment)**

**Movements, behavior, dispersal**

**Species “health” or condition**

**Harvest, recreation**

**Politics**

# Carrying Capacity

General—Maximum numbers of any given species an area can support

Ecologic—maximum numbers w/o detriment to ecosystem or processes

Social—maximum number tolerated by society

# Multiple Use Approach

Wood products (global average use = 25 cubic feet/year / person or about a 100 ft. 16 in diameter tree.

Erosion Control and flood control

Rangelands

Wildlife habitat

# Carrying Capacity

General—Maximum numbers of any given species an area can support

Ecologic—maximum numbers w/o detriment to ecosystem or processes

Social—maximum number tolerated by society

## Management Problem: *Cervus fictitious*

**Winter Habitat Carrying Capacity and Range Management**

-  GRASSLAND
-  CONIFER
-  WOODLAND
-  SCRUB
-  CROPLAND
-  Wetland

— 100m

 1 ha

Landcover	Area	Road Effects	Forage/ha	Total	Total Deer
Grassland	31	30	196	5880	
Conifer	155	140	10	1400	
Woodland	200.9	190.9	40	7636	
Scrub	70.4	65	30	1950	
Cropland	29	26	75	1950	
Wetland	19	16	200	3200	
	505.3			22016	<b>101.9259259</b>

Kg/ha forage

**GRASSLAND** 196

**CONIFER** 10

**WOODLAND** 40

**SCRUB** 30

**CROPLAND** 75

**Wetland** 200

- 1.2 kg/day intake for deer
- Winter Season
- 50% reduction in use w/in 100m of roads
- Winter home range @ 1 km<sup>2</sup>
- Habitat needs: Forage, cover, water w/in homerange

What is the winter carrying capacity?  
 What is the maximum supportable density?  
 What management steps could be used to increase carrying capacity?
