

**DIPHENHYDRAMINE**  
**(dye-fen-HY-drah-meen)**  
**Benedryl**

**PHARMACOLOGICAL CLASSIFICATION:**

-ethanol-amine-derivative antihistamine

**THERAPEUTIC CLASSIFICATION:**

- antihistamine (H<sub>1</sub>-receptor antagonist)
- anti-vertigo agent
- sedative-hypnotic
- anti-cholinergic agent

**MECHANISM OF ACTION:**

- inhibits histamine release and effects
- antihistamines compete for histamine H<sub>1</sub>-receptor sites on the smooth muscle of the bronchi, GI tract, uterus, and large blood vessels
- prevents access of histamines and suppresses histamine-induced allergic reactions

**INDICATIONS:**

- anaphylaxis
- allergic reactions
- urticaria
- extraparamidal reaction

**CONTRAINDICATIONS:**

- asthma
- COPD
- pregnancy
- nursing mothers
- acute glaucoma

**SIDE EFFECTS:**

- sedation
- dries bronchial secretions
- blurred vision
- headache
- palpitations
- tachycardia
- hypotension

**INTERACTIONS:**

- MAO inhibitors prolong CNS depression and anticholinergic effects
- CNS depressants

**DOSAGE:**

-25 to 50 mg IV or IM
